

■ AI Data Analyst - Executive Analysis Report

■ Executive Data Analysis Report

1. Executive Summary

- **Question:** *What are the top 3 payment methods?*
- **Answer:** The three most frequently used payment methods in the dataset are **Cash** (4,310 transactions), **Digital Wallet** (4,144 transactions), and **Credit Card** (4,121 transactions).

These methods together account for a large majority of all transactions, indicating strong consumer preference for cash and digital alternatives.

2. Dataset Overview & Data Quality Profile

Aspect Details
----- -----
Rows × Columns 12,575 × 11

| **Duplicates** | 0 (none found) |

| **Missing Values** | • *Item*
• *Price Per Unit*
• *Quantity*
• *Total Spent*
• *Discount Applied* |

| **Potential Issues** | *Transaction Date* stored as a string (date■time parsing may be required for time■based analyses) |

| **Data Quality Notes** | The missing values are confined to the columns listed above; all other fields are complete. |

3. Data Cleaning & Validation Summary

- **Cleaning Action:** Removed duplicate rows (none existed) and created a clean copy of the DataFrame.
- **Validation Result:** All 12,575 rows passed validation after the duplicate■removal step.

```
# Cleaning performed (already executed) result = df.drop_duplicates().copy()
```

4. User Query & Analytical Approach

- **User Query:** “What are the top 3 payment methods?”

- **Analytical Methodology:**

1. **Select** the **Payment Method** column.
2. **Count** occurrences of each distinct payment method (**value_counts**).
3. **Sort** counts in descending order.
4. **Extract** the top three entries (**head(3)**).
5. **Reset index** and rename columns for readability.

This approach directly yields the most common payment methods and their transaction frequencies.

5. Python Analysis Code & Executed Data Output

Code

```
# Count occurrences of each payment method, sort descending, and take the top 3 result = (
df['Payment Method'] .value_counts() .head(3) .reset_index() .rename(columns={'index': 'Payment
Method', 'Payment Method': 'Transaction Count'}) )
```

Executed Output

| Payment Method | Transaction Count |

|-----|-----|

| Cash | 4,310 |

| Digital Wallet | 4,144 |

| Credit Card | 4,121 |

(The table reflects the exact counts returned by the executed code.)

6. Key Insights & Strategic Recommendations

• Insight 1 – Cash Dominance:

Cash remains the most popular payment method, slightly edging out digital alternatives.

Recommendation: Ensure ample cash handling resources (e.g., staff training, secure cash storage) at high-traffic locations.

• Insight 2 – Strong Digital Wallet Adoption:

Digital wallets are a close second, indicating rapid consumer shift toward contactless payments.

Recommendation: Promote digital wallet incentives (e.g., discounts, loyalty points) to further accelerate adoption.

• Insight 3 – Credit Card Usage:

Credit cards still capture a significant share of transactions.

Recommendation: Maintain robust credit-card processing infrastructure and consider partnerships with card issuers for co-branded promotions.

• Overall Strategy:

A multi-channel payment strategy is essential. While cash cannot be ignored, investing in digital wallet capabilities and optimizing credit-card processing will cater to the evolving preferences of the customer base and potentially increase transaction volume.
